Introduction

Continuous
Splines

Hyperplane
Arrangements

Connections

- Pure n -dimensional polytopal complex $\Delta \subset \mathbb{R}^n$
(subdivision of region homeomorphic to n -dimensional ball
by convex polytopes)
- Module $C^0(\Delta)$ of continuous functions piecewise
polynomial with respect to Δ
- Hyperplane arrangement $\mathcal{A} \subset \mathbb{K}^n$ (\mathbb{K} a field) (union of
hyperplanes in \mathbb{K}^n)
- Module $D(\mathcal{A})$ of vector fields tangent to \mathcal{A}

Algebraic structure (in particular, *freeness*) of $C^0(\Delta)$ and $D(\mathcal{A})$ depend on

- Combinatorics of Δ (number of faces of dimension i) and \mathcal{A} (*intersection lattice* of \mathcal{A})
- Geometry of Δ, \mathcal{A} (how each is embedded in ambient space)

Algebraic structure (in particular, *freeness*) of $C^0(\Delta)$ and $D(\mathcal{A})$ depend on

- Combinatorics of Δ (number of faces of dimension i) and \mathcal{A} (*intersection lattice* of \mathcal{A})
- Geometry of Δ, \mathcal{A} (how each is embedded in ambient space)

We'll discuss

- What is freeness? (contextually)
- Why should anyone care? (implications of freeness)
- What connections are there between $D(\mathcal{A})$ and $C^0(\Delta)$?
What light do these shed on freeness in the two contexts?

Continuous Spline

A continuous piecewise polynomial function.

Notation:

- $C^0(\Delta)$ = continuous piecewise polynomial functions over a subdivision Δ
- $C_d^0(\Delta)$ = \mathbb{R} -vector space of splines whose restriction to each polytope is a polynomial of degree $\leq d$

Main problem: Compute $\dim C_d^0(\Delta)$.

$\widehat{\Delta}$

Coning Construction

Two Tales of
Freeness

Michael
DiPasquale

Introduction

Continuous
Splines

Hyperplane
Arrangements

Connections

- $\widehat{\Delta} \subset \mathbb{R}^{n+1}$ denotes the cone over $\Delta \subset \mathbb{R}^n$.

Δ

0

$\widehat{\Delta}$

- $C^0(\widehat{\Delta})$ is always a **graded** module over $\mathbb{R}[x_0, \dots, x_n]$
- $C_d^0(\Delta) \cong C_d^0(\widehat{\Delta})$ [Billera-Rose '91]

Consequences of Freeness

Two Tales of
Freeness

Michael
DiPasquale

Introduction

Continuous
Splines

Hyperplane
Arrangements

Connections

- Freeness of $C^0(\widehat{\Delta}) \implies$ straightforward computation of $\dim C_d^0(\Delta)$.

Consequences of Freeness

Two Tales of Freeness

Michael DiPasquale

Introduction

Continuous Splines

Hyperplane Arrangements

Connections

- Freeness of $C^0(\widehat{\Delta}) \implies$ straightforward computation of $\dim C_d^0(\Delta)$.
- Freeness of $C^0(\widehat{\Delta})$ is highly studied:
 - via localization [Billera-Rose '92]
 - via sheaves on posets [Yuzvinsky '92]
 - via dual graphs [Rose '95]
 - via homologies of a chain complex [Schenck '97] (Δ simplicial)

C^0 for Simplicial Splines [Billera-Rose '92]

$C^0(\widehat{\Delta}) \cong A_{\Delta}$, the face ring of Δ .

Map is $T_v \rightarrow x_v$ (v not the cone vertex)

Consequences:

- $\dim C_d^0(\Delta) = \sum_{i=0}^n f_i \binom{d-1}{i}$ for $d > 0$, where $f_i = \#i\text{-faces of } \Delta$.
- If Δ is homeomorphic to a disk, then $C^0(\widehat{\Delta})$ is free as a $S = \mathbb{R}[x_0, \dots, x_n]$ module.
- If Δ is shellable, then degrees of free generators for $C^0(\widehat{\Delta})$ as S -module can be read off the h -vector of Δ .

A seminal result of Terao relates freeness of $D(\mathcal{A})$ with the cohomology ring of $\mathbb{C}^\ell \setminus \mathcal{A}$.

Theorem (Terao '81)

If \mathcal{A} is free with exponents a_1, \dots, a_ℓ , then

$$\pi(\mathcal{A}, t) = \prod_{i=1}^{\ell} (1 + a_i t).$$
